ESPOON SÄHKÖ IN 1996

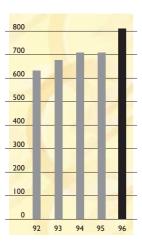

Espoon Sähkö Oy produces, procures and sells electricity, district heat and natural gas. The company provides a comprehensive, competitive and high-quality service which meets the energy needs of its customers. Espoon Sähkö was established in 1918 and it has been listed on the Helsinki Stock Exchange since 1994.

Espoon Sähkö owns the electricity network in the areas of Espoo, Kauniainen and Kirkkonummi, the district heating network in Espoo and Kauniainen, and cogeneration power plants and district heating boilers in Espoo.

The Espoon Sähkö Group comprises the parent company, Espoon Sähkö Oy, together with two property companies: Kiinteistö Oy Espoon Energiatalo and Kiinteistö Oy Piispankylä 4.

MANAGING DIRECTOR'S REVIEW

Business conditions

The change in the structure of Finland's energy sector and its markets which began this decade was much in evidence during 1996 as well. It was the first full year when large customers were able to subject electricity suppliers to competitive bidding. Free competition, however, did not get under way immediately; instead, the activity of the parties increased fairly gradually. Only very few electricity suppliers made a strong effort to enter the market outside their traditional operating areas. In this regard Espoon Sähkö was among the fastest and most active. Determined development coupled with anticipation of the forthcoming change in the market well in advance helped the company make a convincing start to exploiting the new opportunities.

The extent of the change in electricity trading was further increased by the start up of the electricity power exchange in Finland and the opportunity from the autumn to trade on the Swedish-Norwegian Nord Pool power exchange. As the first Finnish member in Nord Pool after Finland's national power companies, Espoon Sähkö was rapidly able to start trading in significant amounts of electricity since price differences in different marketplaces were exceptionally large, especially at the beginning of the autumn. Development since then and the many projects now in the pipeline indicate that the geographical scope of electricity trading will expand. Initially this will cover the entire Nordic region and, as the network of transmission lines is strengthened, bilateral trading with the markets in western Europe will grow.

An important aspect of the change in the structure of this business sector was the fact that the large electricity producers continued to expand also as electricity distributors. On the other hand, no major changes were evident in Finland's towns and cities, which play an important role in the energy sector. Hence, pressure for structural change still exists.

Final decisions on the new national grid

company, Balance Electricity Unit and the possibility for small consumers to buy electricity on the open market, all of which are crucial to electricity trading, still remained to be settled.

Performance

Positive development took place in all matters of central importance to the company's performance during the year. Sales volume increased strongly as the company attracted new customers outside its operating area, as it began trading on the power exchanges, and as sales also increased in the company's own operating area. Total energy procurement costs rose slightly faster than the growth in volume due to increases in the unit prices of purchased electricity and fuels. Pension schemes agreed with personnel offer an opportunity to increase productivity during the next two years.

The profit before provisions and taxes, FIM 156 million, was improved by net financial expenses, which decreased compared to the previous year and turned into financial income for the year. Altogether the company recorded its best financial performance ever in 1996.

Separate financial information for the first time

The Group and parent company accounts for 1996 mark the first time that separate statements for the businesses are also published, as required by the electricity market regulations. These statements have been prepared in accordance with generally accepted accounting principles, which require that the notes to the financial statements must also include the Electricity Division's income statement and the Network Division's income statement and balance sheet. This project made it necessary to define, among other things, criteria for dividing the corporate activities among the divisions, principles for internal transmission pricing, and allocation of balance sheet items to the Network Division. In addition to the separate income statement and balance sheet information, the guidelines also require publication of the key indicators for these businesses.

Prospects

To manage the rapid changes in the sector and the challenges that they pose, the company has initiated several far-reaching development projects. The most important of these are the application of a quality management system, the adoption of an environmental management system and a comprehensive risk analysis and the integration of risk management in the company's daily activities and management.

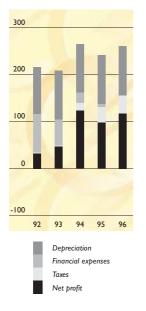

A decision on the structure of future energy procurement also required us to take a position on whether to go ahead with a new power plant investment. Decisions on these issues will be taken during the current year.

The removal of barriers to the electricity markets from the beginning of 1997, and the probable extension of this policy to cover small-scale consumers from the beginning of 1998, further underlines the importance of good customer service, product development, price competitiveness and marketing.

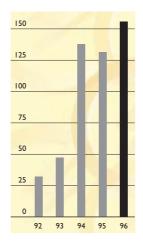

Espoo, March 1997

THE NORDIC ELECTRICITY MARKETS

An important step forward in the formation of a Nordic electricity market was taken in 1996 when power lines in the north of Finland were transferred to Imatran Voimansiirto Oy's (IVS) ownership at the beginning of July. In summer IVS also decided to invest in a power transmission system between Finland and Sweden that will increase transmission capacity by between 300 and 500 MW.

The Nordic electricity markets generate a volume of around 370 TWh and the value of the power distribution market is estimated to be FIM 70 billion. Finland accounts for about 61 TWh and FIM 12 billion of these, according to statistics for 1995.

The Nord Pool common power exchange for Norway and Sweden was established in the winter of 1995-96. This development extended the market area of Statnett Marked AS, which had previously operated only on the Norwegian market. Originally involved were Norwegian producers, purchasers and brokers. These were joined later by Swedish and Finnish companies. Espoon Sähkö became a member of Nord Pool in September 1996.

Finland's national electricity spot market, EL-EX, started up in mid-August 1996. At the start it was only domestic and numbered 32 member companies. At year's end EL-EX gained its first foreign member, Enron Nordic AS. Feasibility studies were also initiated at the close of the year to look into the possibilities for co-operation between the Nordic spot markets.

The launching of the spot market is not highly significant judged by the volume traded

in Finland, at least in its early stages, but it does have a profound effect on the pricing of electricity. The spot market has a unifying and levelling influence on the price of electricity in Finland, and it is expected that price differences will be eroded. On the other hand, the volatility of electricity prices is expected to increase.

This being the case, the importance of upto-date analysis of information on electricity markets will increase. In particular, pronounced changes in the weather will have a effect on the price of electricity. With relatively low price margins in traded electricity, the continuous management of capacity equilibrium and market risks become key factors for success in the new situation. It is predicted that there will be harmonisation of taxes on electricity in the Nordic countries. Although minor differences in taxation will remain between countries, the prices will tend to balance in a single Nordic electricity market as cross-border transmission capacity increases and as the expertise and information technology of the players develop.

Greater integration of the Nordic electricity networks with other European grids and the progress of the electricity market directive in the EU will once again create a new state of affairs. The price level in Europe and the general development of an electricity market in continental Europe will also start to have an impact on the Nordic market.

High-volume transmission possible

The growing volume traded in the Nordic power exchanges will have an intrinsic effect on the volatility of the market price of electricity. In Norway, for instance, daily electricity prices virtually doubled in a short space of time due to poor water availability. Danish power companies especially have exploited the situation by exporting large amounts of electricity from coal condensing power plants to Norway over the year.

In such conditions, relatively large power trading reactions are feasible as the market opens up. The fundamental differences between production capacities of the Nordic countries is of considerable importance in the logic underpinning the Nordic electricity market: ranging from Norway's almost exclusively hydro power to the 97 per cent dominance of thermal production in Denmark.

During 1996 the Finnish company Imatran Voima Oy (IVO) branched out into the Swedish market through a series of corporate acquisitions. IVO now accounts for roughly 10 % of the electricity generated and distributed in Sweden. The Swedish Vattenfall AB has entered the Finnish market by taking over control of the regional power distribution companies Hämeen Sähkö Oy and Lapuan Sähkö Oy, and by concluding large electricity supply contracts with major Finnish industrial consumers.

Change favours large corporate size

The change under way in the electricity markets in many regions around the world gives larger companies the edge. One indication of the extent of this market change is the 50 billion dollars or more spent globally in 1995 alone on corporate acquisitions in the electrical sector, according to one estimate. Such changes continued during the review year. The companies involved are looking to boost efficiency in electricity generation, transmission and distribution by reorganizing an infrastructure once regarded as inherently national and heavily regulated.

Large corporate size in the electricity sector makes risk management much easier and reduces relative operating costs. For instance, a wider framework in energy supply allows operations to be optimized and investments to be scheduled more flexibly. Similarly, product marketing, trading, market analysis, financing, and the development and maintenance of personnel skills are all considerably easier for large companies than for firms working with fewer resources. The driving trend towards deregulated electricity markets is occurring simultaneously in Finland, Sweden and Norway. Preparations are also being made in Finland to interconnect transmission grids. These fundamental changes are making themselves felt at the regional level of the energy business as well.

Large producers of electricity hold a strong position and have extended their business to the retail market. This strengthening of vertical integration appreciably changes the logic on which the electricity market operates. Higher efficiency and better marketing expertise are required of the regional energy sector. The quality of service in handling customer relationships is also of growing importance as customers can now select from between competing energy suppliers.

ESPOON SÄHKÖ AND THE ENVIRONMENT

International environmental agreements and goals are affecting an increasing number of companies and setting new requirements on their operations. With the energy markets now rapidly opening up and becoming more international, the competitive efficiency of energy companies, those in Finland included, will also depend on how they manage their environmental responsibilities. Corporate customers in particular are choosing their energy partners not only on price but increasingly on their commitment to environmental responsibility.

The environmental management system

Espoon Sähkö has initiated a quality development programme which includes integrating environmental considerations in the company's operations.

The company began work on preparing an environmental management system in spring 1996 with an environmental audit based on documents, visits to the company's various plants and properties, and interviews with staff. The work involved the use of outside expertise. The report notes that on the whole the company has managed its environmental responsibilities well and in compliance with official regulations. Aspects requiring further development were definitions of environmental tasks and responsibilities and waste disposal accounting. In accordance with the report's proposals procedures will be formulated enabling the company to comply with the international ISO 14001 environmental standard.

The company's Environmental Policy, confirmed in January 1997, is the basis for its environmental activities. The environmental management system will be basically implemented in early 1997. Personnel will receive training to help them participate in drawing up the system as experts in their own fields. After further action and training based on internal audits, the system will be completed by the end of the year. An environmental programme, including goals and action, will be prepared as the work progresses. In 1997 the company will concentrate on building up the system, and on educating the entire personnel in environmental matters. No decision has yet been made on applying for certification of the environmental management system. The system and action will be monitored regularly to ensure that the company's standard of environmental protection is raised.

The energy company and lifecycles

As a company both producing and selling energy, Espoon Sähkö is part of a chain extending from fuel procurement to energy consumption by the end user, the customer. The preparation of the environmental management system also involves a systematic survey of the environmental impact of the company's operations. The most important of these arise from energy production. Construction of the electricity network and power plants mainly affects the landscape and use of land.

Through its own activities Espoon Sähkö

ENVIRONMENTAL POLICY OF ESPOON SÄHKÖ OY

THE COMMITTED, GOAL-ORIENTED AND PROACTIVE MANAGEMENT OF OUR ENVIRONMENTAL RESPONSIBILI-TIES IS INTEGRAL TO OUR OPERA-TIONS.

We are continuously engaged in developing our operations to reduce and prevent adverse effects on the environment and to promote the rational use of energy.

We are open and active in communicating about our activities and their environmental impact.

We train our personnel to be aware of the environmental impact of the company's and their individual activities, and we encourage them to take responsibility for improving the state of the environment.

We value partnerships which promote environmentally positive solutions and procedures. makes every effort to promote efficiency in energy production and consumption and environmental responsibility. For thirty years the company has been producing district heat, an environmentally efficient means of meeting the space heating needs of population centres. When the heat is produced in a larger unit instead of equipment in individual properties, the flue gas emissions are better controlled. Adding electricity generation to heat production, a process called combined heat and power, makes it possible to use up to 90 per cent of the fuel energy. Condensing plants generating only electricity operate at efficiencies of around 40 per cent.

Espoon Sähkö mainly uses coal and natural gas in its energy production. Emissions arising from the combustion of these fuels are efficiently reduced using modern cleaning equipment and combustion techniques. Low-sulphur fuel oil is used mainly in boiler plants as a reserve fuel and at peak consumption periods caused by severe frost.

As part of its R&D activities the company also follows developments in renewable energy sources. Thorough analysis led to the preparation in 1995 of a plan to build a semioffshore wind-power plant in the Espoo archipelago. However, the plan was dropped for financial reasons and due to local resistance. The company is co-sponsoring an international conference on solar energy in Espoo in June 1997.

Espoon Sähkö participated in the SEEP project, implemented in Finland between 1993 and 1996, to create a general database as a source for lifecycle analyses of energy produced in Finland. In the next few years the company will devote attention to the lifecycle effects of its products primarily through development of its own operations and by promoting the rational use of energy and other environmentally positive operating procedures in cooperation with customers and suppliers.

Using energy rationally

Customer service and co-operation with local schools are important means of providing information about the use of energy and its effects. More than 7000 leaflets on energy conservation have been posted to new customers. The Energy in Uusimaa programme, repeated in 1996 for the eighth time, introduced the company and energy and environment aspects to more than 3000 eighth-grade school children in the operating area. The company and two local schools were also involved in gathering material for the MOTIVA Energy Conservation Centre's national energy conservation project directed at second-grade school children. Uppergrade schools in the area also received a copy of the computerized Power energy teaching programme.

Espoon Sähkö is also represented on a City of Espoo committee which during 1996 prepared a follow-up report on the city's energy conservation programme and participated in drawing up an environmental protection programme for the years 1997-2000.

Environmental studies and analyses

An environmental risk evaluation was included in a risk analysis of the company conducted in spring 1996 and in a programme of projects, based on this analysis, to develop the company's risk and safety management capabilities.

Espoon Sähkö, together with other energy companies in the Helsinki metropolitan area,

participates in the air quality monitoring conducted by the Helsinki Metropolitan Area Council (YTV). At the end of 1996 the Meteorological Institute completed a study analysing nitrogen oxide emissions in the area, determining nitrogen oxide concentrations using a dispersion model, and developing a nitrogen fall-out model on a city scale. Although nitrogen emissions from energy production account for almost half of total emissions in the area, their impact on ground-level nitrogen oxide quantities and on the nitrogen fall-out is minimal. Traffic exhaust emissions are now, and will continue to be, a major source of air pollution.

A subject of research and development is the potential to make further use of the fly ash and desulphurization products from the energy production process as a raw material in civil engineering and construction projects. The company participated in the construction of an experimental waste disposal site at Ämmässuo in Espoo. This project is studying the suitability of fly ash and desulphurization residue produced at sites such as the Suomenoja power plant as a foundation material for landfill sites. Monitoring and measurements will continue until 1998.

YTV started an analysis in 1996 to determine the use of incinerable municipal waste. The Suomenoja fluidized bed boiler is included in the study as a potential site of application.

Recent environmental discussions have drawn attention to the health effects of fine particles arising from combustion processes. Espoon Sähkö is participating in two studies whose purpose is to establish the origin, dispersion and health effects of inhalable particles.

Environmental investments

Investments totalling approximately FIM 100 million at the beginning of the 1990s have considerably reduced emissions at the Suomenoja power plant. The basic air protection investments comprised a new desulphurization plant in 1991 and measures to reduce nitrogen oxides between 1991 and 1995. No significant investments to reduce emissions will be necessary during the next few years.

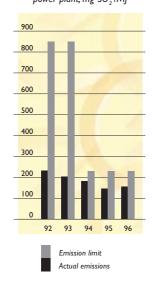

In 1996 the company spent FIM 0.4 million on raising the efficiency of its fly ash discharge systems. The company plans to spend FIM 0.5 million in summer 1997 to improve the desulphurization residue discharge system. These measures will increase reliability, improve the possibility to use fly ash and desulphurization products for construction purposes, and reduce dust emissions at the plant site. In early 1997 the electrode rods in the electrostatic filtering plant, downstream of the desulphurization process, will be replaced with stronger materials.

Emission levels in 1996

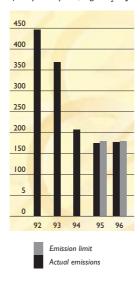

The company's emissions from its production processes are below the regulated levels. The sulphur dioxide emissions per fuel energy unit, ie. the specific emissions from the coalfired steam power plant, were 156 mg SO₂/ MJ.The plant's specific nitrogen oxide emissions were 178 mg NO₂/MJ.The plant's particle levels were also close to the target values despite repeated disturbances to the electrostatic precipitator during the autumn. The specific nitrogen oxide emissions of the gas-turbine power plant were 95 mgNO₂/MJ.

Burning fossil fuels creates carbon dioxide emissions. As the company's energy production volume rose, CO_2 emissions also increased and calculated emissions totalled 835,000 t.

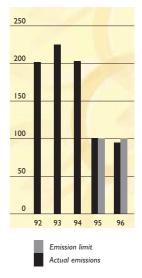

Specific emissions of sulphur dioxides at the Suomenoja coal-fired power plant, mg SO₂/MJ

Specific emissions of nitrogen oxides at the Suomenoja coalfired power plant, mg NO,/MJ

Specific emissions of nitrogen oxides at the Suomenoja gas turbine power plant, mg NO₂ /MJ

ELECTRICITY DIVISION

The Electricity Division is responsible for selling, marketing and procuring electricity. Roughly 40 % of the Division's electricity is supplied by Espoon Sähkö Oy's own power plants, the remainder being purchased from electricity wholesalers or on power exchanges. The Division has 109,000 customers. There were 47 employees at the end of the year.

The electricity business became more international when Finland's cross-border lines were partially opened in autumn 1996. The occasionally large electricity price differences in the Nordic markets offered greater scope for electricity trading. Protection of national interests in all the Nordic countries by legal and fiscal means is still hampering free trade. Nevertheless, the common Nordic electricity market has offered new opportunities to Espoon Sähkö.

The EL-EX Sähköpörssi electricity spot market was set up in Finland in the summer and Espoon Sähkö began trading on the exchange as a member in August. In September the company joined the Norwegian-Swedish Nord Pool spot market and has been active in electricity trading on both exchanges.

Spot markets are only one means of electricity trading, however. Until now, and

DID YOU KNOW ?

WE PROCURED 19 % MORE ELECTRICITY DURING 1996. for the foreseeable future, electricity trading will be based primarily on short or long bilateral electricity supply contracts.

Hence, the spot market will not entirely displace existing means of trading. It appears more likely, in fact, that the volume of trading on the spot market will not increase until confidence in the availability of spot market electricity rises and price forecasts become more reliable.

In most of Finland's largest towns and cities electricity companies purchase less than half of the electricity they sell, although in rural districts this share exceeds 80 %. In Espoo roughly 60 % of the total electricity supply is procured from outside the area. If Espoon Sähkö makes the decision to build a new combined heat and power plant, the share of externally procured electricity in proportion to current volumes will fall to around one-third. Only about half of the Share of Group net sales 44 %

electricity distribution companies in Finland also have own electricity generation.

In the expanding electricity markets it is becoming increasingly important to develop new operating models and to base operations on customer needs. Segmentation and specialization will be challenges in the future.

Prices affected by several factors

A number of factors were evident in the market, some of which raised and some lowered electricity procurement and generation costs. Costs were raised by a sharp increase in wholesale prices at the beginning of the year, an electricity tax which came into force at the beginning of 1997, and prices of imported fuels. On the other hand, successful efforts were made to reduce the impact of these increases by raising operational efficiency and developing new forms of electricity procurement.

Increases in Imatran Voima Oy's electricity wholesale prices raised market prices by more than 10 %. These increases did not affect Espoon Sähkö's prices to their full extent, however, since Espoon Sähkö also has electricity generation of its own.

Despite increases in electricity procurement costs during the year, the company needed to raise sales prices by only 2-3 % due to an increase in volume. This meant a further improvement in Espoon Sähkö's price competitiveness.

The Electricity Division's operating volume rose substantially during 1996 as new customers were gained. The colder weather compared to the previous year was also a partial factor in raising electricity sales.

Sales margins decisive

More important than absolute price development for companies operating in the electricity markets is the development of price margins for electricity. Companies able to outperform their competitors in electricity procurement, for example by developing their own structure of supply and expertise, will have a distinct advantage.

Stiffer competition, on the other hand, will force procurement costs down in the future, as will greater operating efficiency and the new dynamics created, among other things, by the spot markets. The net impact of factors

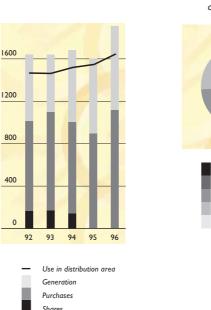

raising or lowering costs is still difficult to predict.

The fundamental change in the electricity markets can be described by noting that whereas Espoon Sähkö previously exercised exclusive control over its operating area, its market share today is only 5 % of the national electricity retail market. This emphasizes the need for greater efficiency throughout the organisation. Since price has been the main yardstick for choosing an electricity supplier, Espoon Sähkö has placed special priority on developing its expertise, organisation and business processes to raise cost efficiency.

Customers have rapidly become aware of the available alternatives. Until now customers have regarded the procurement cost of electricity as a minor factor, but as companies face strong pressure to raise profitability and cut costs customers are showing increasing interest in the price of electricity as well. Market developments indicate, however, that in this transition period private consumers have had excessively high expectations concerning prices.

Only minor changes took place in Espoon Sähkö's customer base, thanks to long-term sales contracts. On the other hand the company gained a number of new customers. Sales is concentrated on the Helsinki metropolitan area, where a significant amount of electricity contracts are also made for other areas in Finland.

A significant role will also be played by small-scale consumers, who will probably enter the competitive arena from the beginning of 1998.

ENERGY DIVISION

The Energy Division's operations comprise electricity and heat production and district heating. The Energy Division sells the electricity it cogenerates with heat to the Electricity Division, which covers about 40 % of its total electricity procurement volume. The Energy Division had 151 employees at the end of the year.

Roughly 70 % of the building volume in Espoon Sähkö's area of operation is supplied with district heat, 15 % relies mainly on electrical heating, and the remainder comprises individually heated properties which almost invariably use oil heating.

The scope for expanding combined heat and power production depends largely on the extent to which sales of district heat can be increased. The potential for district heat, in turn, depends crucially on local building and construction trends.

The strongest advantages of district heating are that it is easy to apply, environmentally clean and cost-competitive. District heating is viewed favourably by both consumers and developers. Espoon Sähkö has made every effort to keep the cost of its district heating stable.

The cost-efficiency of a district heating network depends on how large its coverage is; in Espoon Sähkö's case, this is good.All major population centres in the Espoo area are connected to each other via the main district heating network.

When Espoo's population centres were originally interconnected and the entire district heating network was looped to improve its reliability, it was necessary to build a number of strong trunklines. Now that the basic structure of the network is in place, local expansion is easier and building additional local distribution networks makes better financial sense.

The most efficient means of producing district heat is through combined heat and power (CHP), a technique in which Finland is a leading pioneer in the world. CHP reduces electricity production costs substantially compared to electricity generation in condensing power plants. Centralized production also enables the company to implement sufficient environmental investments for cleaning flue gases, which individual and small

heating plants are unable to do.

The development of the district heating markets has a significant impact on the company's profitability: firstly through growth in its district heating operations, and secondly through the possibility to increase electricity generation using the CHP process. In this respect Espoon Sähkö's location in the Helsinki metropolitan area, Finland's fastest growing region, puts it on a solid foundation.

Record electricity production

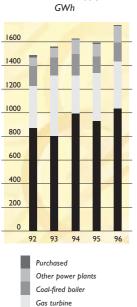

Sales of district heat rose 10 % as a result of colder weather than during the previous year and an increase in the number of customers. Together with the excellent availability of the power plants, this also raised the company's own electricity generating volume by a full 12 % on the previous year.

During the year the company began regional heating at Kalajärvi in Espoo. Heat is initially being produced by a portable oil-fired heating boiler.

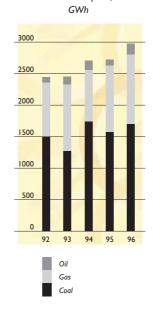

Increased production also raised fuel consumption by 10 % but the relative shares of the different fuels used remained roughly unchanged: coal 58 %, and natural gas 37 %.

Flue gas emissions from power generation were managed well. Sulphur emissions totalled only about two-thirds of the official guidelines.

Coal-fired power plant

Fuel consumption,

NETWORK DIVISION

The Network Division is responsible for distributing electricity to customers. The Division constructs, operates and maintains the electricity network and is responsible for customers connected, or due to be connected, to the network. Its largest customer is Espoon Sähkö's Electricity Division. Some 36,000 customers are connected to the network. The Network Division had 58 employees at the end of the year.

The Electricity Market Act requires that each electricity network operator is assigned a specific geographical area. Within this area the operator holds exclusive building and electricity transmission rights. Network companies are also required by law to distribute electricity in their own operating areas, a service which should be reasonably and fairly priced. Network operators are supervised by the Electricity Market Centre, which operates under the Ministry of Trade and Industry.

Espoon Sähkö operates to the highest international standards of network management. Its graphic network information systems, developed over a period of ten years, are able to integrate vast amounts of individual data from its electricity network. This data makes it easier to dimension and schedule the use and construction of the

DID YOU KNOW ?

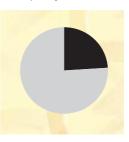

OUR ELECTRICITY NETWORK IS ABOUT 5,000 KM LONG, AND MORE THAN ONE-THIRD IS IN UNDERGROUND CABLES. network, and to raise the average capacity utilization of the electricity network. As a result capital employed is used more effectively, interruptions are rectified more quickly and fault times are significantly reduced.

Deregulation of the electricity markets has provided new opportunities for serving customers. Operating the network is increasingly a customer service function. It includes providing a connection service for new customers, pricing of transmission services, advice on drawing up supply contracts, and making the contracts themselves. Altogether fifteen separate new transmission contracts were made during the year. Thirty-four remote-readable hour meters, which increase scope for outside competition, were installed in Espoon Sähkö's operating area. As expected, sales of external suppliers in the area remained very low.

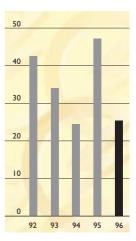

The new Electricity Safety Act became law on I September 1996, which opened inspection to competitive tender where this function had previously been the official responsibility of electricity companies. It also meant a substantial reduction in the number of sites requiring inspection. Espoon Sähkö Oy will continue to offer its customers inspection services also in the new competitive situation.

The Network Division's capital expenditure remained relatively minor and mostly involved replacement investments. In the future overhead transmission lines will be

Share of Group net sales 24 %

Network investments, MFIM

renewed or increasingly replaced with underground cables. The latter's share of the network has been growing at an annual rate of about one per cent and underground cables now account for 33 % of the mediumvoltage network and 42 % of the low-voltage network. Altogether 787 new customers were connected.

According to all essential criteria 1996 was the second best in the company's history. Few medium-voltage disturbances leading to permanent faults occurred. Interruptions averaged 80 minutes during the year, and less than half of these were caused by faults. To maintain the high level of capacity utilization the company is giving priority to maintenance of the overhead transmission line corridors, which is a faster and more economical way of reducing the number of faults than installing cables.

CONTRACTING DIVISION

The Contracting Division builds and maintains electricity networks and their equipment. The Division is also responsible for building street and road lighting networks, area and park lighting, and transformer substations. Its largest customer is Espoon Sähkö's Network Division. The Contracting Division had 81 employees at the end of the year.

Contracting is a service function based on building and maintenance contracts. Success in this business requires simultaneous management of many individual work stages, close logistical control and rapid completion of contracts. The majority of the Contracting Division's work comprises internal assignments to the company network. Outside contracts represent about one-third of its annual volume, the main customers being local municipalities and the National Road Administration. Outside contracts mainly involve the building and maintenance of public and street lighting installations. The main customer for these is the City of Espoo.

Demand in this sector is directly related to municipal growth, new road projects and the construction of new suburbs. Building medium-voltage transmission substations for individual properties and electricity networks

> DID YOU KNOW ? WE SERVICE MORE THAN 44,000 STREET LAMPS.

for industry have taken the place of infrastructure development, which has been in decline in recent years. Having gained solid expertise and experience in building its own network, the Contracting Division is now increasingly contracted to install worksite transformers and property switchgear.

Contracts completed during the year included road lighting and signposting work on the Bemböle-Juvanmalmi section of Ringroad III for the National Road Administration, and street lighting installation at the intersection of Ringroad III and the Turku motorway for Tekra. A 4800 kVA transformer substation was built for Nokia Corporation's new office building at Keilalahti.

Contracting is a labour-intensive business, which emphasizes the importance of high motivation and professional skills. Active measures to promote these have raised average productivity in Espoon Sähkö's Contracting Division by more than 30 % in recent years.

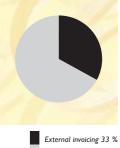

Market outlook

Network capacity was still growing during the 1980s by 5-10 % a year, but this rate has since fallen to only 1-3 % a year during the current decade. Electricity companies have always met their own contracting needs and previously it was not even possible to buy such services anywhere. This means that many companies now face the prospect of having to run down their contracting opera-

Share of Group net sales 2 %

Contract invoicing, %

tions. This will be necessary before a larger nationwide network contracting business can emerge.

Stiff price competition has been a constant feature of the contracting sector in recent years. Only over the past year have signs appeared indicating that customers expect a higher standard of working quality, for example by requiring contractors to demonstrate the use of quality systems in their operations. Overall expertise is assuming greater importance than the simple comparison of unit prices.

BOARD OF DIRECTORS' REPORT 1 JAN. - 31 DEC. 1996

Overview

Electricity consumption in Finland increased 1.6 % during 1996 and totalled 70 TWh (billion kWh). The rise in household consumption was 4.4 % and in the service sector, 2.0 %.

Espoon Sähkö Oy supplied 2.4 % of total electricity consumption in Finland (2.2 % in 1995). Sales of the company's main product, electricity, rose 21 % and amounted to 1836 (1522) GWh in 1996. Electricity sales increased 7 % in the company's own operating area. Sales of electricity outside the operating area came to 259 (53) GWh, a significant share of which was derived from sales to the Finnish EL-EX and joint Norwegian-Swedish Nord Pool power exchanges. The company became a member of EL-EX in the summer and began trading on 16 August 1996. Trading on Nord Pool began in September 1996.

Heat sales totalled 1624 GWh in 1996, which was 10 % more than during the previous year. Calculated in degree days, the year was 10 % colder than 1995 but corresponded with long-term trends. The particularly cold months at the beginning of the year were balanced by a warmer spell towards the end of the year. Altogether 109 new properties were connected to the district heating network. 1996 was the first full year of operation since the deregulation of the electricity markets. The liberalisation of competition did not have a major impact on the company's electricity sales during the year since the company has long-term contracts with its largest electricity customers.

Net sales

Espoon Sähkö Oy's consolidated net sales rose 14 % and were FIM 809 (708) million. Electricity sales and transmission increased 16 % and totalled FIM 547 (470) million. The growth in electricity sales was mainly due to an increase in sales outside the company's operation area. District heat sales rose 8 % and totalled FIM 234 (216) million, which was principally due to increased heat consumption compared to the previous year. Other sales, construction and maintenance of public lighting, and sales of local heat and natural gas, totalled altogether FIM 28 (21) million.

Expenses

The Group's operating expenses totalled FIM 552 (469) million. Energy expenses rose 20 % on the previous year, which was the result of strong growth in sales volumes, especially outside the operating area. The company achieved a new production record, 790 GWh; this was 12 % more than during 1995 and was made possible by increased district heat sales. The company generated 41 (44) % of its total electricity supply. Operating expenses other than energy expenses came to FIM 179 (158) million. Personnel expenses included an additional FIM 10 million cost arising from a personnel pension scheme. Net financial items became positive, ie. income was FIM 0.4 million more than expenses.

Result

The Group's operating profit before depreciation was FIM 260 (241) million, which represented 32 (34) % of consolidated net sales. The operating profit increased 13 % and was FIM 155 million, and the profit before provisions and taxes rose 19 % and was FIM 156 (131) million.

Financing

The Group's liquidity was good. On 31 December 1996 interest-bearing debt was FIM 123 million, and financial assets totalled FIM 353 million. FIM 132 million in loans were amortised during the year. The solvency ratio, excluding connection charges, was 45 % and including connection charges, 75 (68) %. Other key indicators describing the company's financial performance and per share data are given in the annual report.

Investments

Investments in fixed assets amounted to FIM 78 million in 1996. FIM 25 million of this involved investments in the electricity network. Construction of the district heating network required FIM 17 million. Production investments totalled FIM 26 million. The largest project was the purchase of a district heat boiler for the Otaniemi power plant. The company acquired ownership of the sites of its electricity substations and district heating boilers which were previously leased. These acquisitions amounted to approx. FIM 8 million.

Personnel

Personnel averaged 413 (422) during the year. The company had 396 full-time employees at the year end. Pay and other remuneration totalled FIM 77,914,660 (77,710,922), which included FIM 811,414 (838,593) received by the Supervisory Board, the Board of Directors and the Managing Director. No share of profits was paid to the management.

Supervisory Board, Board of Directors and Auditors

The following changes took place in the composition of the Supervisory Board during the year: Mr Jukka Uosukainen acted as the 1 st deputy chairman until 19 March 1996, and thereafter Mr Mika Salonoja. Mr Jari Erholm resigned from the Supervisory Board on 11 April 1996 and Mr Jorma Kari joined the Supervisory Board. No changes took place in the composition of the Board of Directors. The Annual General Meeting elected the following as the company's auditors: Kari Manner APA, Tuomo Vesanen APA and Ole Westerback APA. Jarmo Lohi, APA was elected to perform supervisory accounting.

Prospects for 1997

Further liberalisation of the electricity markets took place at the beginning of 1997 when the 500 kW restriction to free competition was removed altogether. Taxes on electricity production and imports were also removed at the beginning of the year, which is further increasing the dynamics in this sector. For these reasons competition in the electricity markets will continue to expand.

Fundamental decisions due to be taken in Sweden on production capacity and the use of the national grid will have a significant impact on developments in the Nordic electricity markets. More liberal competition, however, will also present new market opportunities. Expanding business volume and population growth in the Helsinki metropolitan area give the company a natural platform for growth in all its core businesses.

Espoon Sähkö Oy is expected to maintain its share of electricity sales in 1997 at the previous year's level. Electricity transmission volumes are forecast to increase on the previous year due to growth in the volume of customers in the company's operating area. Sales of district heat (temperature adjusted) are also expected to rise due to the greater number of customers.

Consolidation

The consolidated financial statements include the parent company, Espoon Sähkö Oy, and the subsidiaries Kiinteistö Oy Piispankylä 4, Kiinteistö Oy Espoon Energiatalo and Viikinki Energia Oy, which are fully owned by the parent company. The consolidated financial statements have been prepared by combining the income statements and balance sheets of the parent company and its subsidiaries. Intragroup income and expenses, mutual receivables and liabilities, internal margins and the internal distribution of profits have been eliminated.

Exchange-rate differences for loans in foreign currencies

Exchange rate differences related to loans and payments in foreign currencies are recorded in the income statement.

Depreciation according to plan

Depreciation is calculated on a straight-line basis. The economic life of fixed assets and long-term expenditure varies as follows:

- buildings 25-40 years
- electricity and district heat network 20-30 years
- machinery and equipment 5-20 years
- other tangible assets 3-30 years

The difference between booked and planned depreciation is shown in the Income State-

ment as a change in the depreciation difference.Accumulated depreciation in excess of plan is shown in the Balance Sheet as a separate item together with provisions.

Research and development expenses

Research and development expenses are booked with annual expenses. Development expenses related to significant investments and made after an investment decision have been capitalized at the acquisition cost of the investment.

Research and development expenses are minor.

Pension arrangements

Pension coverage for the Group's personnel, the members of the Board of Directors, the chairman and vice-chairmen of the Supervisory Board, and the Managing Director has been arranged through pension insurance. The minor uncovered pension liability is shown in the notes to the financial statements.

Direct taxes

Direct taxes in the Income Statement consist of the estimated taxes corresponding to the Group companies' results for the year less the change in provisions, together with tax adjustments for previous years. The deferred tax liability included in provisions has not been booked.

Fixed assets and other long-term investments

Fixed assets have been entered in the Balance Sheet according to direct acquisition cost less depreciation according to plan. Buildings include revaluations allowed by the Bookkeeping Act, which are itemized in the notes to the financial statements.

Other long-term investments include the parent company's receivable in the subsidiary Kiinteistö Oy Espoon Energiatalo.

Inventories

Supply stocks have been evaluated according to the average acquisition cost. Fuel stocks (coal and oil stocks) have been evaluated according to direct acquisition cost on an FIFO basis. Work in progress booked in inventories has been valued at acquisition cost.

Work in progress related to non-core activities is booked under inventories.

Financial assets

Current investments, mainly consisting of bank investment certificates, commercial papers and trustee investments, are included under other current assets.

16. Derivative contracts on power exchanges

Forward contracts and placed option contracts totalled FIM 0.6 million on 31 December 1996.

SUPPLEMENTARY INFORMATION FOR THE SEPARATED OPERATIONS

Electricity companies are required by the Electricity Market Act to separate electricity sales, network operations and electricity generation from each other and from other activities in their financial accounts. The income statements for electricity sales and network operations and the balance sheet for network operations are public information.

The basis for separate accounting at Espoon Sähkö is the divisional organisation. The income and expenses of the divisions are booked as they occur. The company service unit, which provides administrative and financial services for the Group, has reorganised and priced its services as separate products. The divisions pay for these services as they are used. Management overheads are allocated to the divisions in proportion to number of personnel.

In the balance sheet intangible and tangible assets, financial assets and long-term investments, inventories, sales receivables and deferred charges, and accounts payable and deferred liabilities are allocated as they occur. Shareholders' equity, provisions and loans are allocated in proportion to items on the assets side.

Planned depreciation is as follows: on buildings 25-35 years; on the transmission and distribution network, 20-30 years; and on machinery and equipment, 5-10 years.

Electricity and heat prices are based on market and reference prices.

From own cogeneration 790 GWh of electricity was transferred for sale at a price of FIM 177/MWh, and 1450 GWh of heat for FIM 89/MWh respectively.

Average personnel in network operations	121
Investments in distribution and transmission network	FIM 25,447,000
Other investments	FIM 1,376,000
Return on investment at balance sheet values	13.9%
Return on investment when the network is	
valued at its technical current value and depreciation is	
calculated from replacement prices	7.7%
(The calculated deferred tax liability has not been included.)	

Key financial indicators for Network Operations in 1996:

SEPARATED INCOME STATEMENTS

To the shareholders of Espoon Sähkö Oy,

We have audited the accounting, financial statements and the administration of Espoon Sähkö Oy for the financial period I January-31 December 1996. The financial statements prepared by the Board of Directors and the Managing Director provide a review of operations together with an income statement, balance sheet and notes for the Group and the parent company. Based on our audit, we express an opinion on these financial statements and administration.

We have conducted the audit in accordance with Finnish Standards on Auditing. Those standards require that we perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, the assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the financial statements. Our audit of administration included examining whether the Supervisory Board, the Board of Directors and the Managing Director have legally complied with the rules of the Companies Act. Mr Jarmo Lohi, APA has taken care of supervisory auditing during the year.

In our opinion, the financial statements have been prepared in accordance with the Accounting Act and other rules and regulations governing the preparation of financial statements. The financial statements give a true and fair view, as defined in the Accounting Act, of both the consolidated and the parent company result of operations and financial position. The financial statements can be approved, and the members of the Supervisory Board, the Board of Directors and the Managing Director be discharged from liability for the financial period audited by us. The Board of Directors' proposal for the distribution of profit is in compliance with the Companies Act.

We have reviewed the interim reports published during the financial year. In our view, these have been prepared in accordance with applicable regulations.

We have reviewed the income statements, balance sheet and supplementary information for the separated operations in the notes to the financial statements. In our opinion, they have been prepared in accordance with the Electricity Market Act and the regulations and stipulations required by it.

Espoo, 20 March 1997

SVENSK RESUMÉ

KORT OM ESBO ELEKTRISKA UNDER 1996

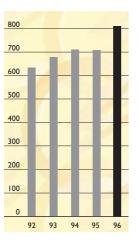

Esbo Elektriska Ab producerar, anskaffar och säljer elektricitet, fjärrvärme och naturgas. Företaget saluför konkurrenskraftiga och högklassiga heltäckande tjänster för att tillgodose kundernas energibehov. Företaget grundades 1918 och noterades i Helsingfors Fondbörs 1994.

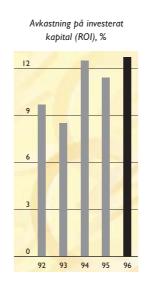

Företaget äger ett elnät som täcker Esbo, Grankulla Kyrkslätt, ett fjärrvärmenät som omfattar Esbo och Grankulla samt samproduktionsanläggningar och värmecentraler i Esbo.

Koncernen Esbo Elektriska består av moderbolaget Esbo Elektriska Ab och två fastighetsbolag, Kiinteistö Oy Espoon Energiatalo och Kiinteistö Oy Piispankylä 4.

VERKSTÄLLANDE DIREKTÖRENS ÖVERSIKT

Branschutveckling

Energimarknaden och energibranschen som började omstruktureras på 1990-talet uppvisade fortsatt kraftiga förändringar under 1996. Detta var det första helår när de största kunderna hade möjlighet att begära in offerter från konkurrerande elleverantörer. Marknadsstarten skedde inte plötsligt, utan parternas aktivitet på marknaden visade en relativt jämn tillväxt. Ett fåtal elleverantörer gjorde en stark inbrytning på en marknad som låg utanför deras traditionella koncessionsområde. Esbo Elektriska var i detta avseende en av de snabbaste och mest aktiva aktörerna. Med målmedvetet utvecklingsarbete och genom att i god tid föregripa förändringarna på marknaden skapades ett gynnsamt utgångsläge för nya affärsmöjligheter.

Den finländska elbörsen inledde sin verksamhet och detta ledde till ännu mer omfattande förändringar av elhandeln. Även möjligheten att från hösten 1996 delta i den elhandel som drivs inom ramen för den svensk-norska elbörsen Nord Pool ASA bidrog till detta. Esbo Elektriska kunde som första finländska medlem i Nord Pool efter de riksomfattande energibolagen snabbt inleda en volymmässigt betydande elhandel. Prisskillnaderna mellan olika marknadsplatser var nämligen exceptionellt stora framför allt i början av hösten. Utvecklingen hittills och ett flertal alltjämt pågående projekt innebär att elhandeln expanderar geografiskt, i inledningsskedet till de övriga nordiska länderna. I takt med att överföringsförbindelserna stärks ökar interaktionen med den västeuropeiska marknaden.

Ett påfallande drag i branschens omstrukturering var att de större elproducenterna fortsatte att expandera även i distributionsledet. Inga genomgripande förändringar skedde dock ännu inom stadsdistributionen, som är av stor betydelse för energibranschen i Finland. Inom denna sektor finns det alltså fortfarande ett tryck mot strukturförändringar.

Vissa frågor som berör de centrala verksamhetsprinciperna i elhandeln väntar alltjämt på sin lösning. Hit hör ett nytt bolag för stamnätet, ett balansansvarigt elbolag och möjligheter för mindre kunder att skapa konkurrens mellan elleverantörerna.

Resultatutveckling

De omständigheter som har avgörande effekter på räkenskapsårets resultat utvecklades positivt. En stark tillväxt av försäljningsvolymen noterades som ett resultat av framgångsrik kundvärvning utanför det egna nätområdet, starten av handeln vid elbörserna och försäljningstillväxten inom det traditionella verksamhetsområdet. Totalkostnaderna för anskaffning av energi växte något snabbare än volymerna till följd av att priset på köpt elektricitet och enhetspriserna för bränslen steg. En pensionsplan som utarbetades med de anställda skapar möjligheter till ökad produktivitet under de närmaste två åren. Resultatet före reserveringar och skatter, som uppgick till 156 miljoner mark, förbättrades från föregående år som ett resultat av minskade finansiella kostnader; på årsnivå omvandlades de till finansiella intäkter. Som helhet betraktat blev året det hittills bästa i resultathänseende.

Bokslutsinformation per affärsområde

l anslutning till koncernens och bolagets resultat publiceras nu för första gången separata resultaträkningar för respektive affärsområden, vilket stadgas i lagen om elmarknaden. Resultaträkningarna har uppgjorts enligt allmän praxis, varvid resultaträkningen för affärsområde el och resultat- och balansräkningarna för affärsområde nät skall upptas som noter till det egentliga bokslutet.

Vid uppgörandet av separata resultaträkningar fastställdes bl.a. normerna för fördelning av bolagsfunktioner på de enskilda enheterna, principerna för prissättning vid intern överföring samt fördelning av posterna i balansräkningen på nätenheterna. Utöver detaljerade uppgifter om resultaträkningar och balansräkningar offentliggörs nyckeltal som uträknats enligt direktiven.

Framtidsutsikter

För att kunna möta de snabba förändringarna och de utmaningar dessa för med sig har ett flertal omfattande utvecklingsprojekt inletts. De mest betydande av dessa är införande av kvalitetsstyrning, ett miljöstyrsystem, heltäckande riskbedömning samt riskstyrning så att denna blir en integrerad del i företagets dagliga verksamhet och ledning.

Som ett led i strukturlösningen för kommande energianskaffning skall avgörande även nås om investering i ett nytt kraftverk. Beslut om dessa frågor kommer att fattas under 1997.

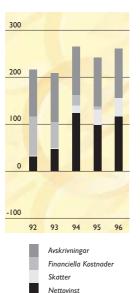

Avregleringen av elmarknaden i början av 1997, vilket i praktiken väntas omfatta även mindre kunder från början av 1998, understryker betydelsen av god kundservice, produktutveckling, priskonkurrens och marknadsföring.

STYRELSENS VERKSAMHETSBERÄTTELSE

Verksamhetsberättelse

Elförbrukningen i Finland uppgick till totalt 70 TWh (mrd. kWh) under 1996, en ökning med 1,6 % jämfört med året innan. Inom privathushållen steg förbrukningen med 4,4 % och inom tjänstesektorn med 2,0 %.

Esbo Elektriska Ab stod för 2,4 % av elförbrukningen i hela landet (2,2 % under 1995). Försäljningen av elektricitet, som är företagets viktigaste produkt, ökade under 1996 med 21 % till 1 836 (1 522) GWh. Elförsäljningen inom bolagets koncessionsområde växte med 7 %. Försäljningen utanför koncessionsområdet uppgick till totalt 259 GWh (53 GWh). En betydande del av försäljningen utanför koncessionsområdet gick till elbörserna, EL-EX och nordiska Nord Pool. Företaget anslöt sig till EL-EX på sommaren och elhandeln inleddes 16.8.1996. Handeln inom Nord Pool startade i september 1996.

Försäljningen av värme uppgick till totalt I 624 GWh under 1996, en ökning med 10 % jämfört med året innan. Räknat på basis av nyckeltalet temperatur/ dagar var det 10 % kallare under 1996 än året före, men detta motsvarade medelvärdena under en längre period. De mycket kalla månaderna i början av året jämnades ut av den varma perioden i slutet av året. Under 1996 anslöts 109 nya fastigheter till fjärrvärmenätet.

1996 var det första hela verksamhetsåret efter avregleringen av elmarknaden. Även om marknaden öppnades för konkurrens, hade detta inga större effekter på företagets elförsäljning, eftersom bolaget hade ingått långtidskontrakt med större elkunder.

Omsättning

Koncernen Esbo Elektriska ökade sin omsättning med 14 % till 809 (708) miljoner mark. Försäljningen och överföringen av elektricitet steg med 16 % till 547 (470) miljoner mark. Det var främst elförsäljningen utanför ansvarsområdet som bidrog till ökningen. Försäljningen av fjärrvärme växte med 8 % till 234 (216) miljoner mark. Tillväxten berodde främst på ökad försäljningsvolym jämfört med föregående år. Övrig försäljning, byggande och underhåll av utomhusbelysning samt försäljning av närvärme och naturgas uppgick till totalt 28 (21) miljoner mark.

Kostnader

Koncernens driftskostnader uppgick till totalt 552 (469) miljoner mark. Energikostnaderna steg med 20 % jämfört med året före som ett resultat av kraftigt ökade försäljningsvolymer framför allt utanför företagets ansvarsområde. Företaget noterade rekord i producerad elvolym: 790 GWh, vilket motsvarade en ökning på 12 % från föregående år. Den ökade försäljningen av fjärrvärme möjliggjorde rekordproduktionen av elektricitet. Egen produktion stod för 41 (44) % av den totala elanskaffningen. Övriga driftskostnader frånsett kostnaderna för energi uppgick till totalt 179 (158) miljoner mark. I personalkostnader ingår en extraordinär kostnad på 10 miljoner mark för pensionsarrangemang. Finansnettot blev positivt, d.v.s. intäkterna översteg kostnaderna med 0,4 miljoner mark.

Resultat

Koncernens driftsbidrag blev 260 (241) miljoner mark, vilket utgjorde 32 (34) % av omsättningen. Rörelsevinsten ökade med 13 % och uppgick till 155 miljoner mark. Koncernens resultat före reserveringar och skatter steg med 19 % till 156 (131) miljoner mark.

Finansiering

Koncernens finansiella ställning är god. De räntebärande skulderna uppgick till

123 miljoner mark 31.12.1996 och de finansiella tillgångarna till 353 miljoner mark.
Amorteringar på lån uppgick till 132 miljoner mark under räkenskapsåret. Soliditeten frånräknat anslutningsavgifter uppgick till
45 % vid slutet av året och soliditeten inklusive anslutningsavgifter uppgick till 75 (68) %.
Övriga nyckeltal för bolagets ekonomiska utveckling och relationstal för aktien presenteras på annat ställe i årsredovisningen (på finska).

Investeringar

Investeringarna i anläggningstillgångar uppgick till totalt 78 miljoner mark under 1996. Av detta investerades 25 miljoner mark i elnät. Till utbyggnad av fjärrvärmenätet användes 17 miljoner mark. Investeringar i produktion uppgick till totalt 26 miljoner mark. Det mest betydande objektet var inköp av en vattenpanna till kraftverket i Otnäs. Bolaget köpte in tidigare hyrda tomter för elstationer och värmecentraler. Tomtaffärerna uppgick till totalt ca 8 miljoner mark.

Personal

Antalet anställda uppgick till 413 (422) i medeltal under räkenskapsåret. Antalet fast anställda var 396 vid slutet av året. I löner och arvoden utbetalades 77 914 660 (77 710 922) mark, av vilket löner och arvoden till ledamöter i förvaltningsrådet och styrelsen samt verkställande direktören utgjorde 811 414 (838 593) mark. Inga partiella arvoden har utbetalats till företagsledningen.

Förvaltningsråd, styrelse och revisorer

Under räkenskapsåret skedde följande förändringar i förvaltningsrådets sammansättning: förste vice ordförande Jukka Uosukainen efterträddes 19.3.1996 av Mika Salonoja. Ledamoten Jari Erholm avgick från förvaltningsrådet 11.4.1996 och ersattes av Jorma Kari. Inga förändringar inträffade i styrelsens sammansättning. Bolagsstämman valde följande personer till revisorer: CGR Kari Manner, CGR Tuomo Vesanen och CGR Ole Westerback. CGR Jarmo Lohi utsågs att verkställa övervakningsrevision.

Utsikter för 1997

Avregleringen av elmarknaden fortgick under början av 1997, när bestämmelsen om en minimieffekt på 500 kW, som begränsat konkurrensen till storkunder, helt slopades. När skatterna på produktion och import av elektricitet avskaffas i början av året, kommer detta att ytterligare öka dynamiken i elhandeln. Konkurrensen på elmarknaden kommer därför att tillta ytterligare.

De principbeslut som Sverige kommer att fatta om produktionskapacitet och stamnätsdrift har betydelse för utvecklingen av den nordiska elmarknaden.

När marknaden öppnas för konkurrens innebär det å andra sidan även nya möjligheter. Den snabba utvecklingen av näringslivet och befolkningsökningen i huvudstadsregionen skapar en naturlig tillväxtpotential inom företagets centrala affärsområden.

Esbo Elektriska Ab förväntas bibehålla sin marknadsandel för elförsäljning på oförändrad nivå under 1997.Volymerna för elöverföring förutses växa jämfört med föregående år som ett resultat av ökat kundunderlag inom ansvarsområdet. Även den temperaturkorrigerade försäljningsvolymen för fjärrvärme beräknas växa till följd av ökat kundunderlag.

INFORMATION FOR SHAREHOLDERS

Shareholders' meeting

The Annual General Meeting of Espoon Sähkö Oy shareholders will be held on Wednesday 16 April 1997, beginning at 4.00 pm at the Hotel Kuninkaantie in Espoo, street address Lakelankatu I. Shareholders will be entitled to participate in the annual meeting who have registered their names in the company's share register maintained by the Finnish Central Securities Depository Ltd by 4 April 1997. Shareholders whose shares have not been transferred to the book-entry system will also be entitled to participate in the shareholders' meeting provided they were registered in the company's share register before 30 September 1994. In this case shareholders must present their share certificates or other proof that the right to shares has not been transferred to a book-entry account.

Shareholders who wish to participate in the annual meeting must give notification by 4.00 pm on 14 April 1997 either in writing to Espoon Sähkö Oy, Osakerekisteri, P.O. Box 109, FIN-02201, Espoo, or by phone to +358-9-8048 0802. Any power of attorney on the basis of which an agent is authorized to vote for a shareholder by proxy should be sent to the company before the period of notification expires.

Payment of dividends

The Board of Directors proposes to the Annual General Meeting that a dividend of FIM 2.20 per share be distributed for the financial year 1996. The record date for dividend payments will be 21 April 1997 and the payment date will be 24 April 1997 if the Board's proposal is approved.

Shareholders who have not transferred their shares to the book-entry system by the record date will be paid dividends when their shares have been transferred to the system.

Financial publications in 1997

Espoon Sähkö Oy will publish interim reports on the first four months of the year on 12 June 1997 and on the first eight months of the year on 16 October 1997.

Please write to the following address for financial publications: Espoon Sähkö Oy, Piispanportti 10, P.O. Box 109, FIN-02201 Espoo, Finland. Phone +358-9-804 801, and fax. +358-9-8048 0238. These may also be ordered on the Internet by filling out the return coupon at http://www.esoy.fi/.
